The static loss analysis presents the percentage of balances charged off, based on the fiscal year the credit account was originated and the period the balance was charged off. The percentage computed is calculated by dividing the cumulative amount charged off since origination, net of recoveries, by the original balance of accounts originated during the applicable fiscal year. Period 0 is the year of origination.

The impact of the change in estimate for future sales tax recoveries was approximately 10 to 20 bps and was reflected in the net static loss rate for the quarterly period related to the three month period ending uly 31, 2016 (period 10 for FY14, period 6 for FY15 and period 2 for FY16).
T represents the terminal loss percentage - the point at which that pool of loans has reached its maximum loss rate.
The origination amount includes sales taxes and other amounts that are not included in retail net sales.
As a result of our decision to pursue collections of past and future charged-off accounts internally rather than selling charged off accounts to a third-party, recoveries will be received later and interim static loss rates will higher than historical experience until the terminal static loss rate is reached. This will impact net loss results for periods occurring after October 31, 2014.
The FY15 and FY16 vintages include originated balances of higher quality equal pay no-interest ("EPNY") loans. In February of 2016, we discontinued originating this product and began to offer similar EPNI products hrough a third party partner, Synchrony Financial. Current cumulative loss rates excluding these higher quality EPNI accounts would increase the FY 15 vintage from $14.4 \%$ to approximately $14.7 \%$ and the FY 16 vintage from $15.3 \%$ to approximately $16.8 \%$. We believe that these adjusted historical loss rates are more comparable to our more recent originations.
